

Your brain runs on interest, not importance.

Most productivity advice assumes an importance-based nervous system, one that responds to deadlines, consequences and "because I should." Many ADHD brains run on an interest-based nervous system instead, reaching for dopamine through 5 triggers grouped as INCUP, coined by Dr. William Dodson.

Think of one task you keep avoiding, and fill this in:

I

Interest

Genuine curiosity releases the dopamine that makes engagement possible, sometimes effortless. Find the angle of the task you actually want to know about.

HOW CAN I MAKE THIS INTERESTING?

N

Novelty

New is stimulating. A different room, a different tool, a different order of doing things can restart a task your brain has filed as boring.

HOW I CAN MAKE IT NEW AGAIN?

C

Challenge

A task can become engaging the moment it turns into something to beat. Difficulty holds attention where obligation can't. Add a constraint: a time limit, a target, a rule, and make the finish line obvious.

WHAT CHALLENGE COULD I ADD TO THIS?

U

Urgency

The 11th-hour clarity is real. You don't have to wait for a crisis to borrow it: timers, body doubling and accountability create urgency on purpose.

URGENCY I CAN CREATE ON PURPOSE?

P

Passion

When something connects to your values or the person you're becoming, motivation lasts past the novelty. Name what the task is really in service of.

WHY DOES THIS MATTER TO ME?

THE ADHD WORKBOOK FOR GETTING UNSTUCK

Manipulating Myself to Do Stuff

9 chapters with research-backed information & over 20+ worksheets to work with your interest-based brain and get you unstuck.
